

NEXIVO X CODEX

Before hardware, I built an AI technical team.

A founder-led deep-tech experiment: turn Codex workers into a trackable pre-MVP technical rhythm.

TRANSPARENCY FIRST

These are not human employees.

- Codex worker codenames
- AI agents with scoped tasks
- No fake personal profiles
- Every output tracked in GitHub

THE TEAM MAP

Meet the Codex workers.

Hypatia

AI CTO

Kierkegaard

Computer Vision

Averroes

Hardware Strategy

Dalton

Biometrics Testing

Aquinas

Open Dataset Research

Boyle

Score Review

ROLE DESIGN

Each worker owns a thinking lane.

- Hypatia reviews strategy and architecture.
- Kierkegaard questions what images reveal.
- Averroes turns hardware choices into evidence.
- Dalton measures biometric scores and thresholds.
- Aquinas tests sources, datasets and method.
- Boyle asks whether the result was actually measured.

PRE-HARDWARE OUTPUT

What they shipped before hardware.

- Python + OpenCV vein biometrics pipeline
- Synthetic smoke test
- Open finger-vein dataset validation
- FAR / FRR and threshold analysis
- Hardware shopping list and setup plan
- First real test protocol

PUBLIC LOG

The proof is not a pitch deck.

Issues**Commits****Docs****Tests****Reviews****Every task has a record.****Every claim points back to work.**

STILL EARLY

This is not product validation yet.

- Real NIR hardware
- First vein image
- Image quality metrics
- FAR / FRR on our own samples
- Liveness / PAD planning
- KVKK / GDPR security review

FOUNDER LESSON

Maybe this is how early teams start.

Few humans.

Well-scoped AI workers.

Transparent logs.

Fast iteration.

Next: capture the first vein image with real NIR hardware.
